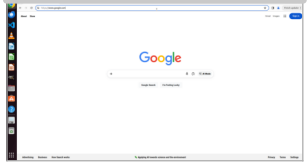
## Task #29 (7 rubrics)

I'm thinking about switching my work setup to a Chromebook, and before I do that I want to sanity-check whether my main tools will actually work. First, please go to Hubstaff's official site and find their guidance about using the desktop app on a Chromebook or ChromeOS, because I need to know whether this would be a normal install or whether I'd have to use some Chrome extension or browser-based workaround instead. Open the actual Hubstaff help or support page that answers this and leave it open so I can look at the wording myself. If it turns out Chromebook use depends more on browser tools, then go to Brave's official site and find the real Chromebook install page or instructions page for Brave so I have the official setup link ready; open that in its own tab too so I can compare both pages side by side. After that, head to Chrome's official developer documentation and look up DevTools AI assistance, then summarize how I would get started with it and what data it uses, since that may matter more if I'm working mostly in the browser on a Chromebook. Please keep the official Chrome docs page open as proof. Finally, use Google to find a clear troubleshooting page for the annoying issue where Chrome keeps opening in Guest mode instead of my normal profile, and click through to the actual help page or forum post that gives step-by-step fixes so I have a recovery reference if this Chromebook browser setup gets weird. Leave that troubleshooting page open too, and then give me a clean summary of the Hubstaff Chromebook compatibility conclusion, the supported ChromeOS option Hubstaff mentions, the official Brave Chromebook install link, the DevTools AI getting-started and data-use summary, and the Guest mode fix steps you found.

**Claude Opus 4.6** | Score: 100%, 69 steps

**Step 1**



*I'll tackle this step by step. Let me start by searching for Hubstaff's Chromebook guidance and...*

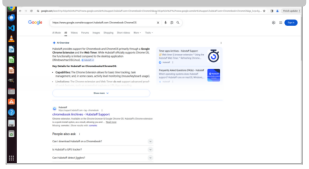
**Step 2**



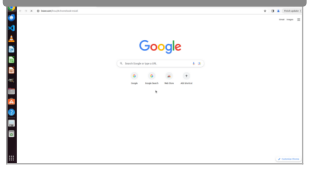
`type("site:support.hubstaff.co...`

2/7 rubrics satisfied

✓ **R1:** Correctly state Hubstaff's official Chromebook compatibility conclusion for the desktop app.

✓ **R2:** Identify the supported Chrome OS option Hubstaff describes for Chromebook users.

**Step 22**



`type("https://brave.com/linux/...`

3/7 rubrics satisfied

✓ **R3:** Provide the official Brave Chromebook install or instructions page URL from brave.com.

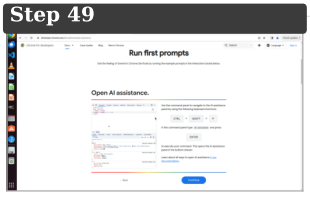
**Step 33**

`type("Chromebook")`

3/7 rubrics satisfied

★ **Uses ctrl+f 'Chromebook'** as a falsification probe: 0/0 matches confirms page is irrelevant, immediately pivots strategy

**Step 49**



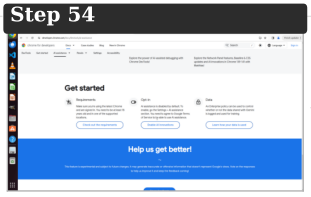
*Excellent! The Chrome DevTools AI assistance page is now loaded. I can see: - Title: "AI assistance" -...*

`scroll()`

4/7 rubrics satisfied

✓ **R4:** Summarize how to get started with Chrome DevTools AI assistance using official Chrome documentation.

**Step 54**



*Now I can see very important information at the bottom of the page: 1. Getting Started...*

`scroll()`

5/7 rubrics satisfied

✓ **R5:** Explain what data DevTools AI assistance uses according to official Chrome documentation.

**Step 59**

`type("Chrome keeps opening in ...`

6/7 rubrics satisfied

✓ **R6:** Provide a clear ordered troubleshooting sequence for fixing Chrome opening in Guest mode and restoring the normal profile, based on a source found through Google.

**Step 69**

*Good, the Brave Linux install page is open. The brave.com/linux page is the official Brave installation...*

`DONE`

7/7 rubrics satisfied

✓ **R7:** Return all requested outputs together in one final response: Hubstaff conclusion, supported ChromeOS option, Brave link, DevTools AI summary, and Guest mode fix steps.
